## TELETYPE CLEAR TEXT ALARM

A device is required which will detect the clear text work "CITE" when transmitted to a signal line. Upon detecting this word the device will provide a disabling circuit for the transmitter-distributor and an audible and/or visual alarm shall be given.

All signal lines are monitored by model-14 reperforators. Contact assemblies are available that are operated by the pull bars on the M-14. These contacts can be added so that they are operated by the space, C, I, T, and E pull bars. These contacts can be used to control the Clear Text Alarm device. The Clear Text Alarm device will be either relay or diode operated and contain its own power supply.

August 1958

The CSR-2 (CITE Alarm) program has presented a number of problems. [REDACTED] delivered five production units that were modified in accordance with specifications furnished by OC-SP. Each of these units had different characteristics with respect to radiation and, to further complicate matters, a number of components have experienced failures. These failures have been brought to the attention of [REDACTED] who has supplied five additional units for further tests.
